

Cutting all ties with traditional thinking,  
Cavotec automated mooring comes to the Nordics.

MoorMaster™ is currently in use in Australia, Canada, Denmark, New Zealand and Oman. Compared to lines, the system offers a dramatic reduction in ship motion – for faster loading and unloading.

## Cavotec automated mooring comes to the Nordics

Over the past 100 years, every aspect of shipping has been modernised – with the exception of how we moor ships. However, dock lines can be hazardous, and can slow port operations. That's why Cavotec developed MoorMaster™. Instead of using lines, the system has large vacuum pads that adhere to the sides of ships. So vessels can moor safely or release in just seconds, regardless of tides, swell or weather conditions. MoorMaster™ is now in operation in Denmark, serving a high-frequency ferry link between the ports of Hov and Saelvig.
